

## Emergency Communications IP Platform Goes Digital

by Phil Leggiere  
Monday, 15 March 2010

NOTIFIER, Northford, Conn., a provider of mass notification systems and part of Honeywell Fire Systems Group, has announced that its IP-based emergency communications (a.k.a. mass notification) platform has gone completely digital to optimize speed and intelligibility of emergency communications.

The ONYXWorks workstation is designed to enable users to distribute live audio messages digitally via its NOTIFY-IP Internet gateway to local, regional, national and even international facilities. An intelligent network interface designed by NOTIFIER enables the workstation and IP platform to easily integrate with buildings' new or existing fire alarm voice evacuation systems to provide onsite and remote monitoring and control.
